Introduction

This seminar introduces reservoir engineering concepts and methods to enable cross-disciplinary exchange of ideas and experience. It provides the required input to help you understand questions crucial to the reservoir engineer: How much oil & gas is there (accumulation)? How much can be recovered (reserves)? How fast can it be recovered (rate)? By the end of the seminar, participants will have gained a foundational understanding of reservoir engineering that they can use while moving forward in their training.

This training seminar will feature:

- Discussions on the role of reservoir engineering in exploration and production as well as how reservoir engineers interact with other disciplines in the Petroleum Industry
- A description of Reservoir rock properties, Darcy's Law and Fundamentals of fluid flow in a porous media
- A description of Reservoir fluid phase behavior and reservoir fluid properties
- An Overview of well testing and application of the diffusivity equation
- An outline of different drive mechanisms and discussion of the recovery factors
- Principles of Material Balance and Decline Curve Analysis
- Use of fractional flow equations and Immiscible displacement concepts
- Definition of reserves, estimation of oil and gas in place and Production Forecasts

Objectives

By the end of this training seminar, participants will:

- Describe a hydrocarbon reservoir and list the fluids found in it
- Illustrate with diagrams how these fluids are distributed in a hydrocarbon reservoir
- Describe and explain porosity, permeability and fluid saturations
- Determine the properties of natural gas, oil and water
- Explain and define saturated reservoirs, undersaturated reservoirs, bubble point pressure, oil and gas formation volume factors, gas oil ratio
- Calculate the volume of hydrocarbon in place and recovery factors Derive the general material balance equation, modify it and use it to calculate hydrocarbon in place for gas reservoirs, saturated reservoirs and under saturated reservoirs
- Use the Havlena and Odeh technique to determine oil in place for saturated reservoirs and under saturated reservoirs
- Use of well testing data in determining average reservoir pressure, productivity index, permeability, and skin effect
- Discuss the recovery factors of different drive mechanisms
- Explain the use of fractional flow equations and Immiscible displacement concepts
- Perform decline curve analysis

Training Methodology

This training seminar will utilise a variety of learning techniques to ensure maximum understanding, comprehension and retention of the information presented. The daily workshops will be highly interactive and participative. This involves regular discussion of applications as well as review questions on each topic.

Who Should Attend?

This training seminar is suitable to a wide range of professionals but will greatly benefit:

- Petroleum and Reservoir Engineers who need to determine accurate values of the properties of reservoir gas, oil and water for use in engineering calculations and Simulation studies
- Production and Operations Engineers who want to have an understanding of the way reservoir fluids behave, the reservoir depletion process and reservoir drive mechanisms
- Reservoir, Production and Operations Engineers who need to determine oil and gas production rates and production forecasts
- Petro-physicists, Geo-physicists, Geologists and Non – Engineers who work in teams with Petroleum and Reservoir Engineers to estimate hydrocarbon in place and reserves and to perform reservoir characterisation studies
- Managers who seek to derive greater decision making on field development

SEMINAR OUTLINE

DAY 1

Reservoir and Reservoir Engineering Basics

- Introduction to reservoir engineering
- Reservoir Life Cycle
- Reservoir environment and formation properties
- Identification of contacts
- Definition of reservoir pressure
- Determination of pressure gradients

DAY 2

Reservoir Conditions

- Reservoir and surface conditions
- Formation volume factor, viscosity, solution gas-oil ratio, API gravity, specific gravity
- Estimating gas, oil, and water properties from correlations
- Application of deviation factor to ideal gas law
- Darcy's Law and fundamentals of fluid flow
- Relative permeability concept

DAY 3

Reservoir Fundamentals

- Principles of Well Testing in reservoir characterization
- Estimation of average pressure
- Application of diffusivity equation to steady state, semi-steady state and unsteady-state flow
- Applications of line source solution to determine reservoir pressure

- Overview of well testing techniques
- Use of well testing

DAY 4

Reservoir Drive

- Reservoir Drive Mechanisms
- Principles of Material Balance Analysis
- Use of fractional flow equations
- Immiscible displacement concepts
- Recovery concepts

DAY 5

Reserve Estimation and Production Forecasting

- Definition of reserves
- Recovery factor-API Correlations
- Estimation of oil-in-place
- Estimation of gas-in-place
- Production Forecast – Decline Curve Analysis
